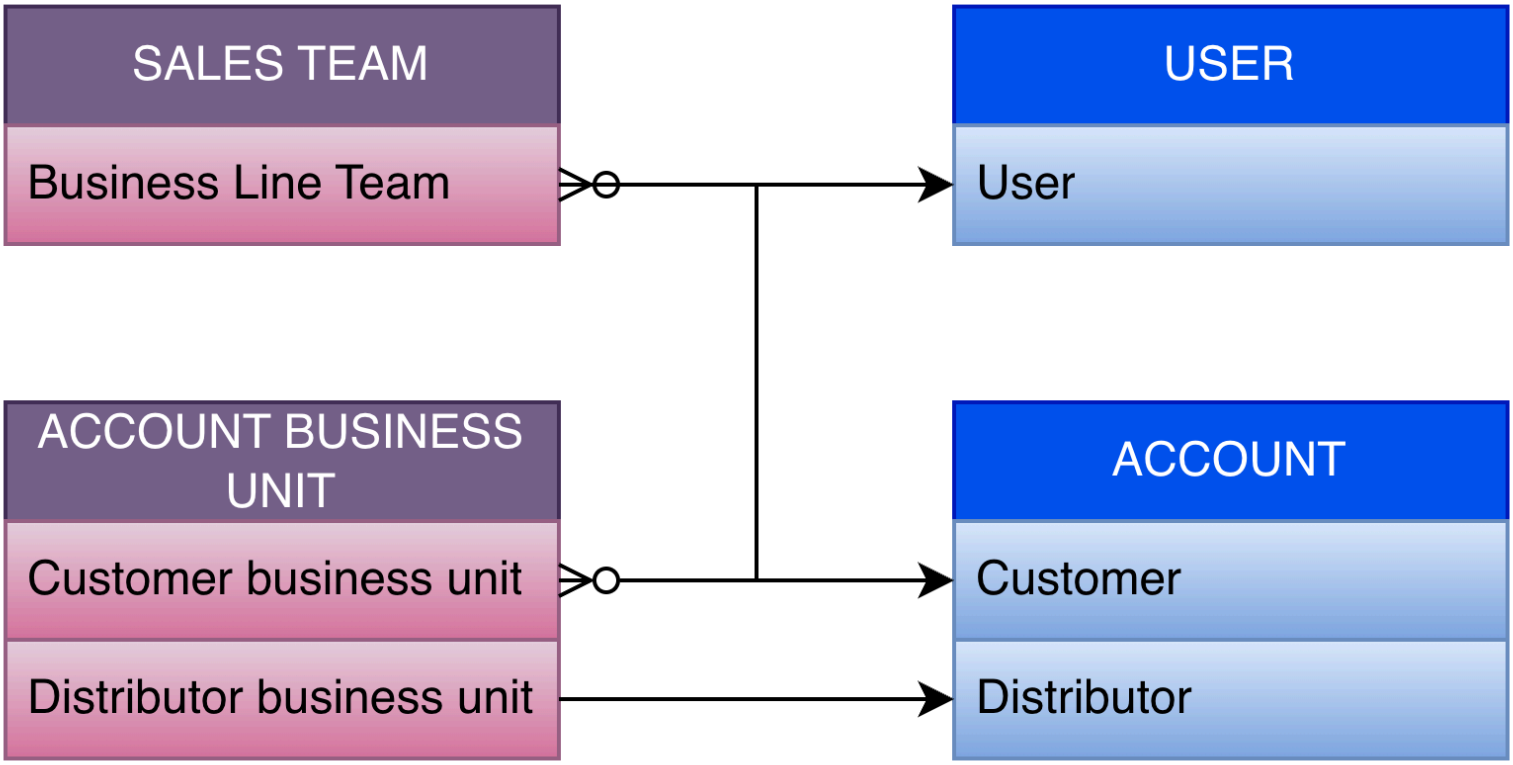
Account Business Unit: Customer Business Unit, Distributor Business Unit



Through this unification object, we will be able to manage the values associated with each Account and, together with the account team member records, manage Account related records (Opportunities, Quotes, Visits, Order Request and Orders) visibility.

For related records, the ideal approach is to have a single Business unit in order to avoid visibility issues and cross-reporting.

Customer Business Unit

To configure the business lines of an Customer, we will use an auxiliary object **Account Business Unit** with RecordType **Customer Business Unit** that allows us to create a 1:N relationship between Account and Business Line through the following fields:

- **Account**: Master-Detail Relationship to Account
- **Business Unit**: Global Picklist

- **Business Line**: Dependent global multi-picklist based on Business Unit **for example** for Blood Gas: GEM Premier / Avoximeter / Crit Care Other
- **Active**: Checkbox used to indicate whether the record is active
- ~~Assigned Rep: User Lookup~~ *Sales Rep Field on Sales Team Object*
- **Potential Customer**: Checkbox used to indicate whether the account it is a BU-specific potential indicator.

Distributor Business Unit

To configure the business unit of an Distributor, we will use an auxiliary object **Account Business Unit** with RecordType **Distributor Business Unit** that allows us to create a 1:N relationship between Account and Business Unit through the following fields:

- **Account**: Master-Detail Relationship to Account
- **Business Unit**: Global Picklist
- ~~**Business Line**: only apply for the "Other" Business Unit - Global Dependent Multi-Picklist~~
- **Active**: Checkbox used to indicate whether the record is active
- **Local/International**: Picklist (Local / International)
- **Technical support**: Picklist (Direct Service / Outsources / Werfen assumes service)
- **Other Brands**: Manufacturer Picklist *TBC*

Prevent Duplicated Records

It is only possible to have one record per relationship between business unit and account.

I am glad to hear it is working perfectly! A well-documented flow is just as important as a well-built one.
Here is a structured and professional documentation draft in English, ready to be copied and pasted into your wiki.

Flow Documentation: AutoCreation Account Business Unit

The **AutoCreation Account Business Unit** flow is designed to automate the creation of `Account Business Unit` records for a customer whenever a relevant `Asset` is created in the system. It ensures data consistency by verifying if an active Business Unit already exists for the account before creating a new one, preventing duplicate entries.

Technical Specifications

- **Flow Label:** AutoCreation Account Business Unit
- **API Name:** `WESAL_vw_autoAccountBusinessUnit`
- **Flow Type:** Record-Triggered Flow
- **Trigger Event:** A record is created
- **Trigger Object:** `Asset`
- **Optimization:** Action and Related Records (After-Save)

Entry Conditions

The flow only triggers when an `Asset` is created and meets **all** of the following criteria:

- The Asset **Record Type** is either `WESAL_rt_werfen` OR `WESAL_rt_competitor`.
- The **Account** (`AccountId`) is not blank.
- The **Business Unit** (`WESAL_fld_businessUnit__c`) is not blank.

Execution Logic & Steps

When the entry conditions are met, the flow executes the following steps:

1. **Get Record Type (`Get_Customer_Business_Unit_RT`):** Retrieves the Salesforce ID for the `WESAL_rt_customerBusinessUnit` Record Type belonging to the `WESAL_obj_accountBusinessUnit__c` object.
2. **Check for Existing Record (`Get_Existing_Account_Business_Unit`):** Queries the system for an existing `Account Business Unit` that matches the following criteria:
   - **Account:** Same as the triggering Asset's Account.
   - **Business Unit:** Same as the triggering Asset's Business Unit.
   - **Record Type:** `WESAL_rt_customerBusinessUnit`.
   - **Status:** Active (`WESAL_fld_active__c` = True).
3. **Decision Node (`Check_Active_Business_Unit`):**
   - **If a record exists:** The flow stops and takes no further action.
   - **If no record exists:** The flow proceeds to the creation step.
4. **Create Record (`Upsert_Account_Business_Unit`):** Creates a new `Account Business Unit` record using the data from the triggering Asset.

Field Mapping for New Account Business Unit

When a new `WESAL_obj_accountBusinessUnit__c` record is created, the fields are populated as follows:

Target Field (Account Business Unit)	Source / Value
RecordTypeId	ID of `WESAL_rt_customerBusinessUnit`
WESAL_fld_account__c	`{!$Record.AccountId}`
WESAL_fld_businessUnit__c	`{!$Record.WESAL_fld_businessUnit__c}`
WESAL_fld_active__c	`True`
WESAL_fld_externalId__c	Formula: `{!$Record.AccountId} & TEXT({!$Record.WESAL_fld_businessUnit__c})`
