Account Plan: Planning

The **Account Plan** custom object with **Planning** Record Type is designed to centralize client-specific analysis, strategic documentation, and real-time operational data. It provides a 360-degree view of the customer's current situation by dynamically linking active commercial records.

Field Label	Data Type	Description / Logic
Account	Master-Detail (Account)	Parent reference.
Analysis Comments	Text Area (Long)	Comments.
Situation	Text Area (Long)	Current snapshot of the client's relationship and status.
Exernal Id	Text, Unique, External Id	Default Value `AccountId` to Prevent Duplicates

Object Configuration & Constraints

- **Relationship:** Master-Detail with **Account** (ensures security inheritance).
- **Cardinality:** Restricted to **1:1** (One Account Plan per Account). -> **Exernal Id**
- **Record Type:** "Planning".

- **Automation (Creation):** A **Record-Triggered Flow** will automatically generate the Account Plan record immediately upon the creation of a new Account -> **Automatic Account Plan Creation**

Dynamic Relationship Logic (Real-Time Sync)

To maintain the "Planning" focus on current operations, the Account Plan will utilize **Automated Link Management**:

1. **Auto-Association:** When an Opportunity or Business Activity is created for an Account, a Flow will automatically populate the **Account Plan** lookup field on those records, linking them to the active Plan.
2. **File Synchronization:** The Account Plan will mirror the **Files** and **SharePoint** related lists of the Parent Account, ensuring that strategic documentation is accessible directly from the planning view.

Instead of creating dozens of manual lookups, the most efficient way to achieve the "Open Only" view in Lightning Experience is:

- **Dynamic Related Lists:** Use the "Dynamic Related List - Single" component on the Account Plan record page.
- **Filter Criteria:** Set the component filter to `StageName NOT EQUAL TO Won, Lost, Mix or Canceled` for Opportunities and `Status NOT EQUAL TO Completed or Canceled` for Activities.

Business Activity: Customer Activity

We will use a new custom object called “Business Activity” to manage the activities carried out within an **Account Plan**, populating the new custom field **AccountPlan** for this purpose.

These activities can be linked to the **Account** via a new custom field **Account**, and to multiple opportunities through a new custom object **Opportunity Activity Relationship** with the Record Type **Opportunity Activity Relation**.

Opportunity Activity Relationship: Opportunity Activity Relation

One activity can be linked to multiple opportunities through a new custom object **Opportunity Activity Relationship** with the Record Type **Opportunity Activity Relation**. To do so, the new custom object must populate the fields **Opportunity** and **Business Activity**.

Some Opportunity Activity Relationship key fields:

- **Opportunity** - Opportunity Lookup
- **Business Activity** - Business Activity Lookup

Files

Documents can be attached directly to an Account Plan using the standard Salesforce Files functionality.

SharePoint Files

To enhance document visibility, we will introduce the **'SharePoint File'** custom object with the **'SharePoint File'** record Type. This entity will serve as a bridge between SharePoint and Salesforce, allowing for the association of external files with specific **Account** and **Account Plan** records. By capturing the document’s name and its direct URL, the system provides a centralized repository for all relevant account-related collateral hosted on SharePoint.

Some key fields:

- **Account** - Master-Detail Relationship to Account
- ~~**Account Plan** - Account Plan Lookup~~
- **Name** - Text (File Name)
- **URL** - URL (File URL)
- **File** - Formula Text: `HYPERLINK( WESAL_fld_url__c, Name , '_blank')` It allows you to display the record name and open the URL in a new tab.

At this stage, a native API integration with SharePoint for automated file retrieval or downloads is **out of scope**. Instead, records within the **'SharePoint File'** object will be created manually by Sales users. These records will serve as relational links, accessible via the **Account** and **Account Plan** page layouts, providing direct navigation to the externally hosted documents.
