Customer Data Model

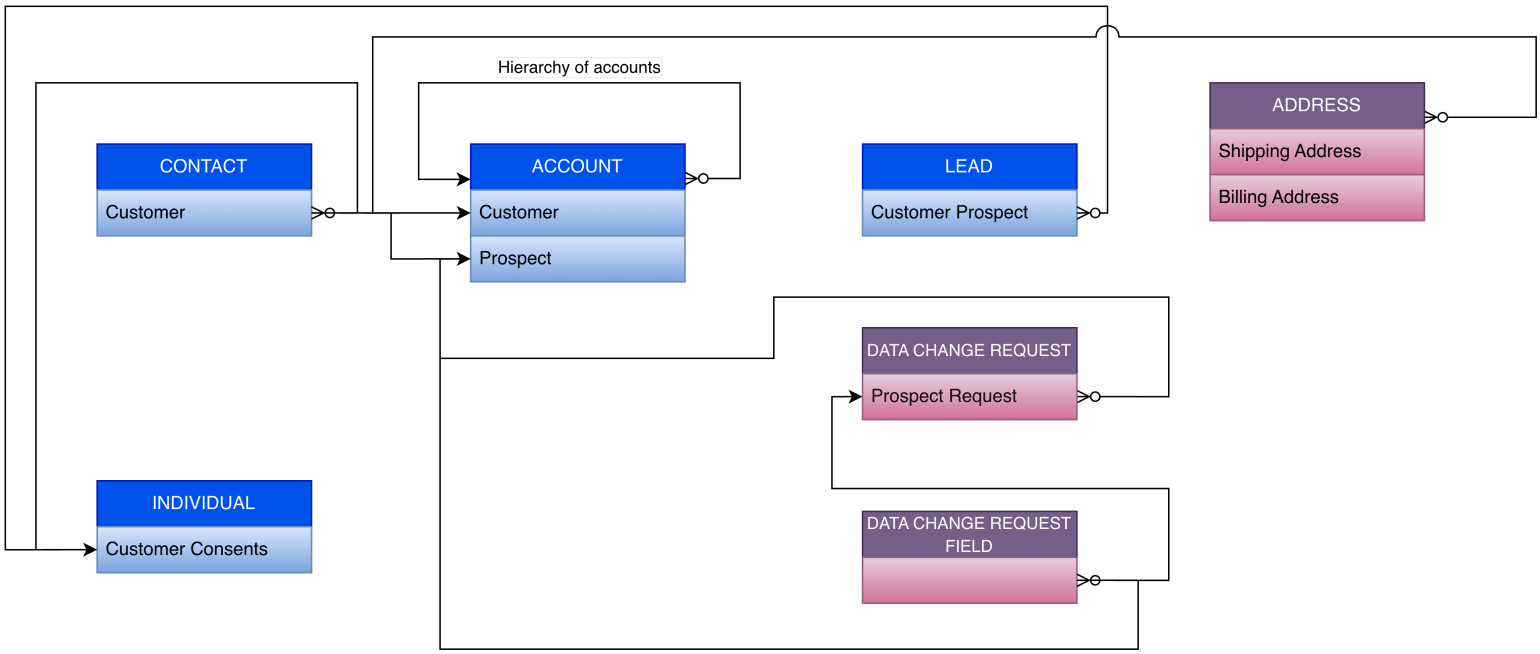
We will use several Salesforce objects to ensure the correct and efficient management of all information. To achieve this, the following objects will be employed:

Standard

- **Account**: This object will record primary information for Customers (qualified customers), Distributors, and Prospects (customers awaiting qualification validation).
- **Contact**: This will contain information related to the contacts of either a customer or a prospect. These are linked to a customer account.
- **Lead**: This object facilitates the initial registration of a new customer prospect prior to the necessary validations for qualification as a "Prospect" type Account

Custom


- **Data Change Request**: This object is used to record information for Prospect-type Accounts that must be submitted to SAP for validation.
- **Data Change Request Field**: Identifies specific changes made to a "Prospect" type Account to gather necessary data for SAP transmission and maintain historical traceability.
- **Address**: It includes the different addresses of a customer, differentiating between “shipping” and “billing” types.
- **Task Participant**: This object will be used to collect information submitted during events via Marketing Cloud.
