Customer Possible Scenarios

To illustrate the practical application of the customer prospect qualification process, we have identified several possible scenarios that outline the workflow:

1. **Scenario 1: New Customer Prospect –** Occurs when there is a requirement to register a new record of the **Customer Prospect** type within the system.
2. **Scenario 2: New Customer Contact –** Occurs when a **new contact** must be registered and associated with one or more **existing accounts**.
3. **Scenario 3: Marketing Cloud –** Occurs when a user submits their information through a **Marketing Cloud** webinar registration.

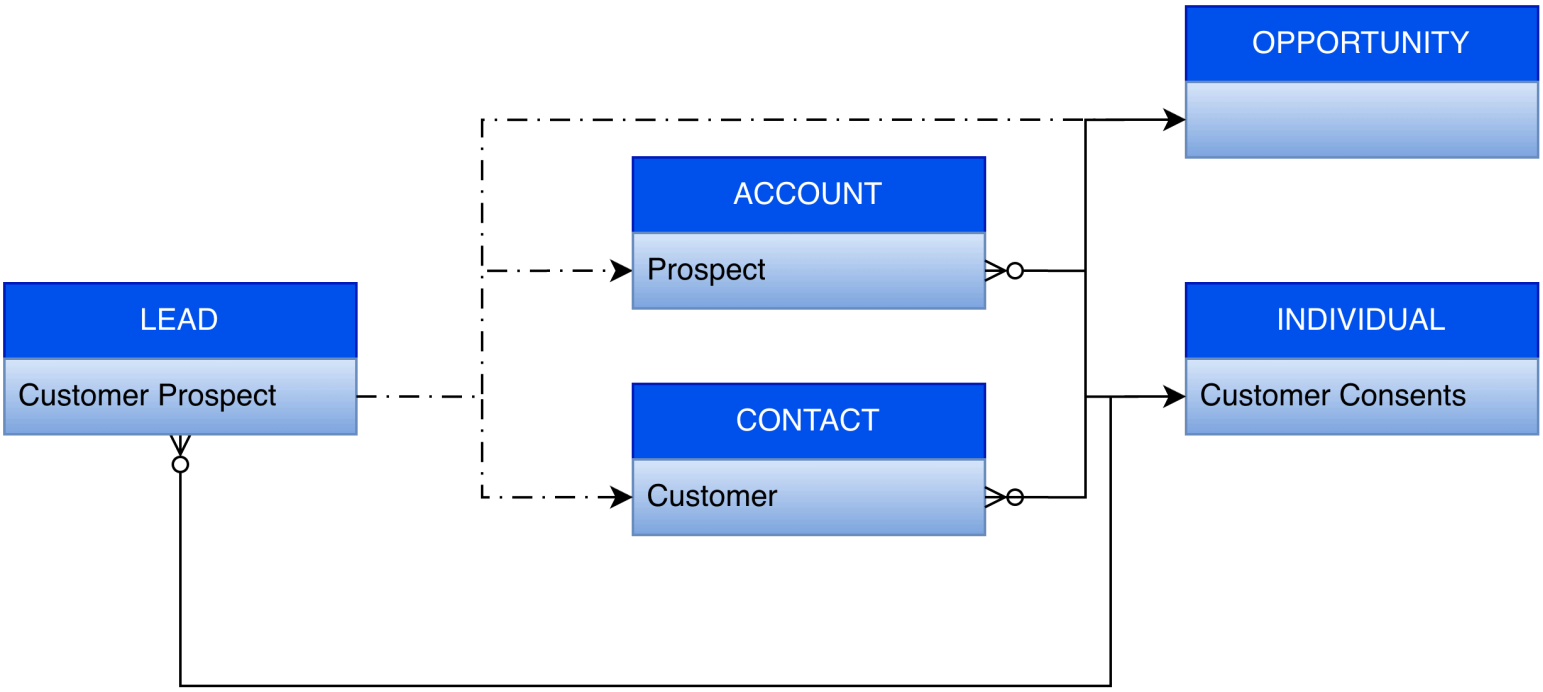
Scenario 1: New Customer Prospect

To register a new Customer Prospect record in the system (given that both **Customer** and **Distributor** Account records originate from SAP and cannot be generated directly in Salesforce) the process will begin with the creation of a new record in the **Lead** object. All minimum required information must be captured at this stage to successfully generate a Prospect-type record

- Name
- Address
- Account Type (Sold to, Account group 0001)
- Language
- Telephone
- Email
- Currency
- Sales Org (by default)
- Sales District

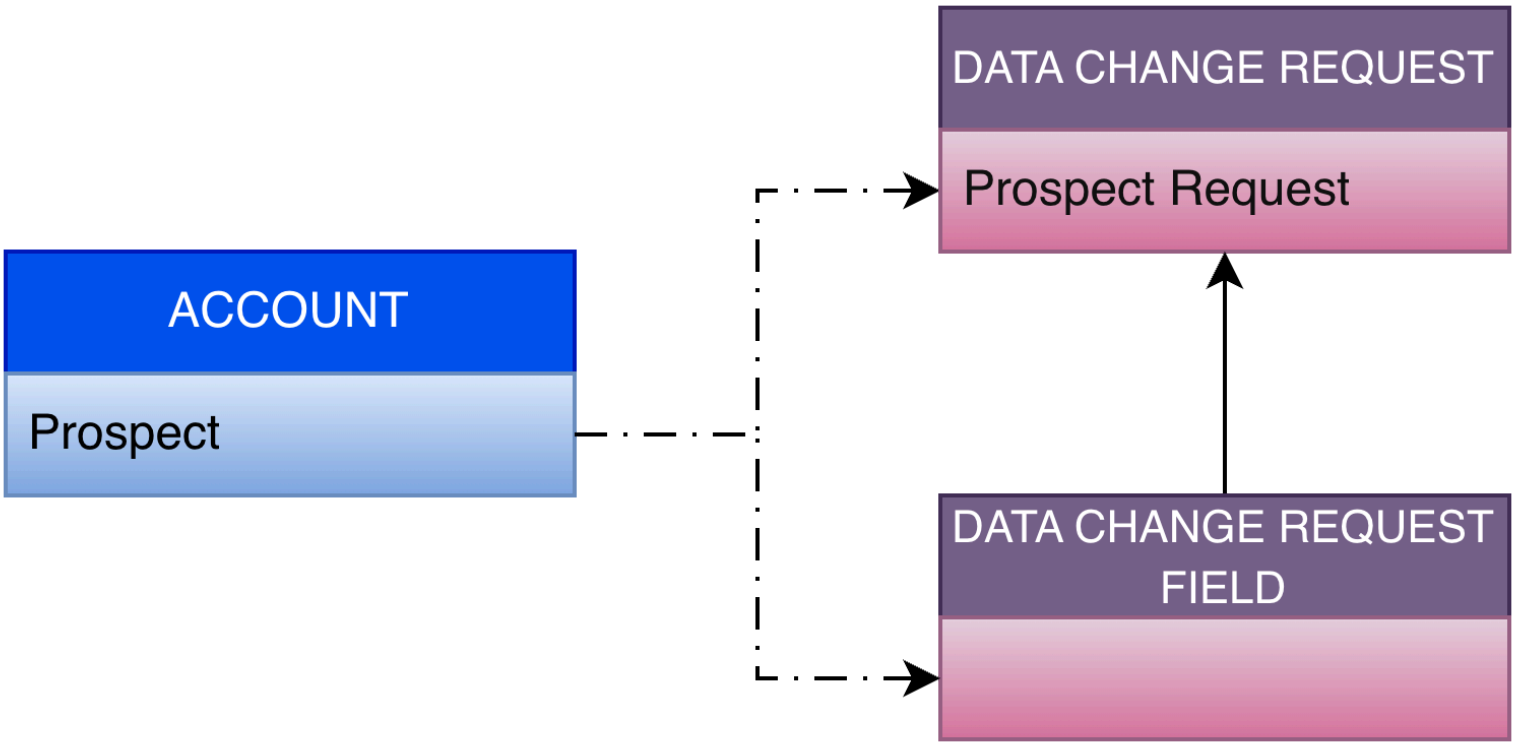
Additionally, **consents and preferences** can be collected in the **Individual** object per user (they receive an automated email to inform themselves in the **Marketing Cloud Preference Center** once registered in Salesforce).

This information will remain in the **Lead** object until a sales user confirms that the contact can be qualified. At that moment, Salesforce will automatically generate a **Prospect Account** (with the Type value set to **Customer**) and an associated **Contact** based on the lead information. During this process, Salesforce performs a duplicate check to ensure neither the Account nor the Contact already exists. If consents were registered in the **Individual** object, the new Contact will inherit those preferences and consents from the Lead.



It is important to note that when qualifying a lead in Salesforce, we can also automatically generate an opportunity associated with the new Prospect Account created during qualification, thereby streamlining the workflow. Opportunities associated with a Prospect Account cannot progress through the entire defined workflow until they have been validated in SAP.

Since a preliminary validation has already been performed to generate the new **Prospect Account** record, we can now automatically generate the validation request for SAP. Along with the creation of the Prospect Account, the necessary records will be generated in the **Data Change Request** and **Data Change Request Field** objects to consolidate all required information for transmission to SAP.



- **On-Demand Online Transmission:** After the Prospect Account is generated, the user is allowed to make modifications to the record; the submission to SAP is then triggered by a button labeled "Send to SAP".

However, once a Prospect record has been submitted to SAP, its modification could be restricted. Similarly, once SAP validates the record, it's record type changes from Prospect to Customer, at which point it can no longer be modified directly within Salesforce.

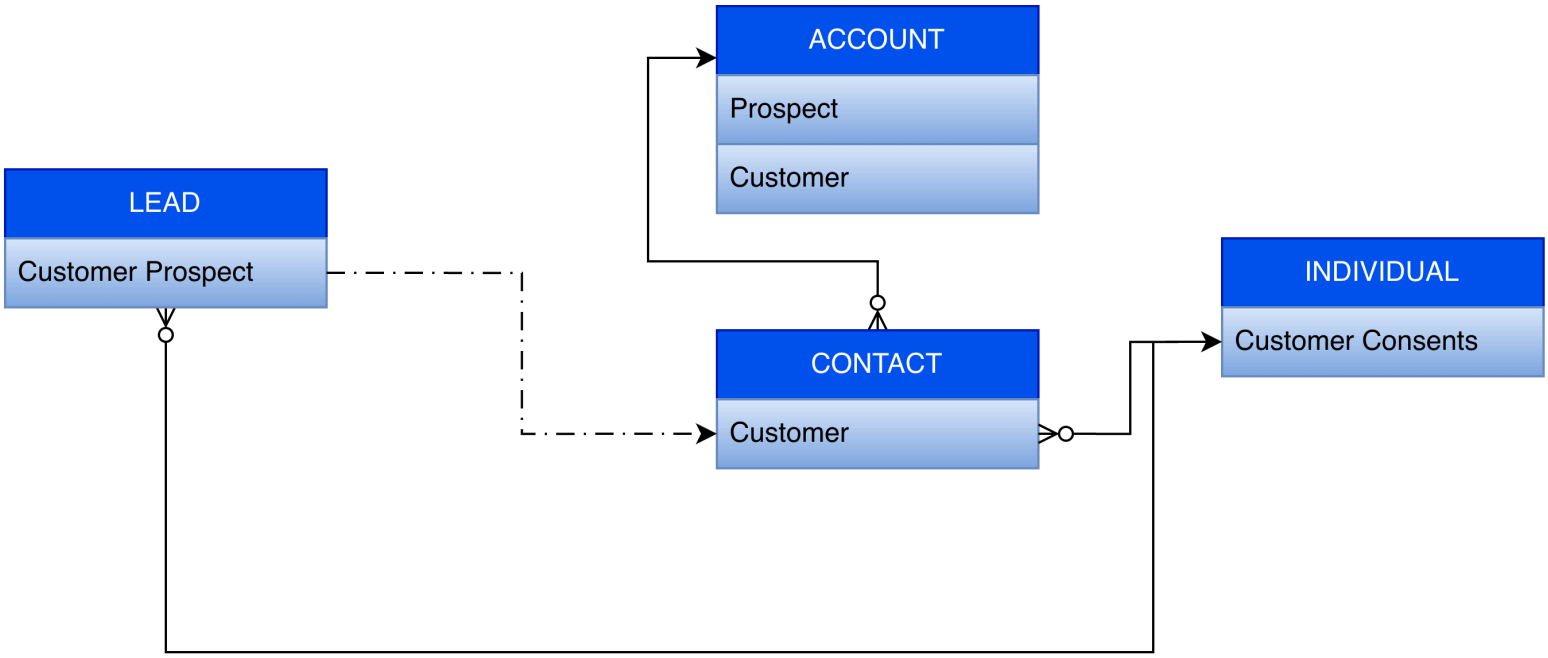
Salesforce will serve as the master directory for contact records. Any contact generated from a lead can be modified and associated with other accounts. This does not affect any of the processes mentioned above.

Scenario 2: New Customer Contact

If we need to generate a new contact in Salesforce associated with an existing Account, there are two distinct ways to achieve this:

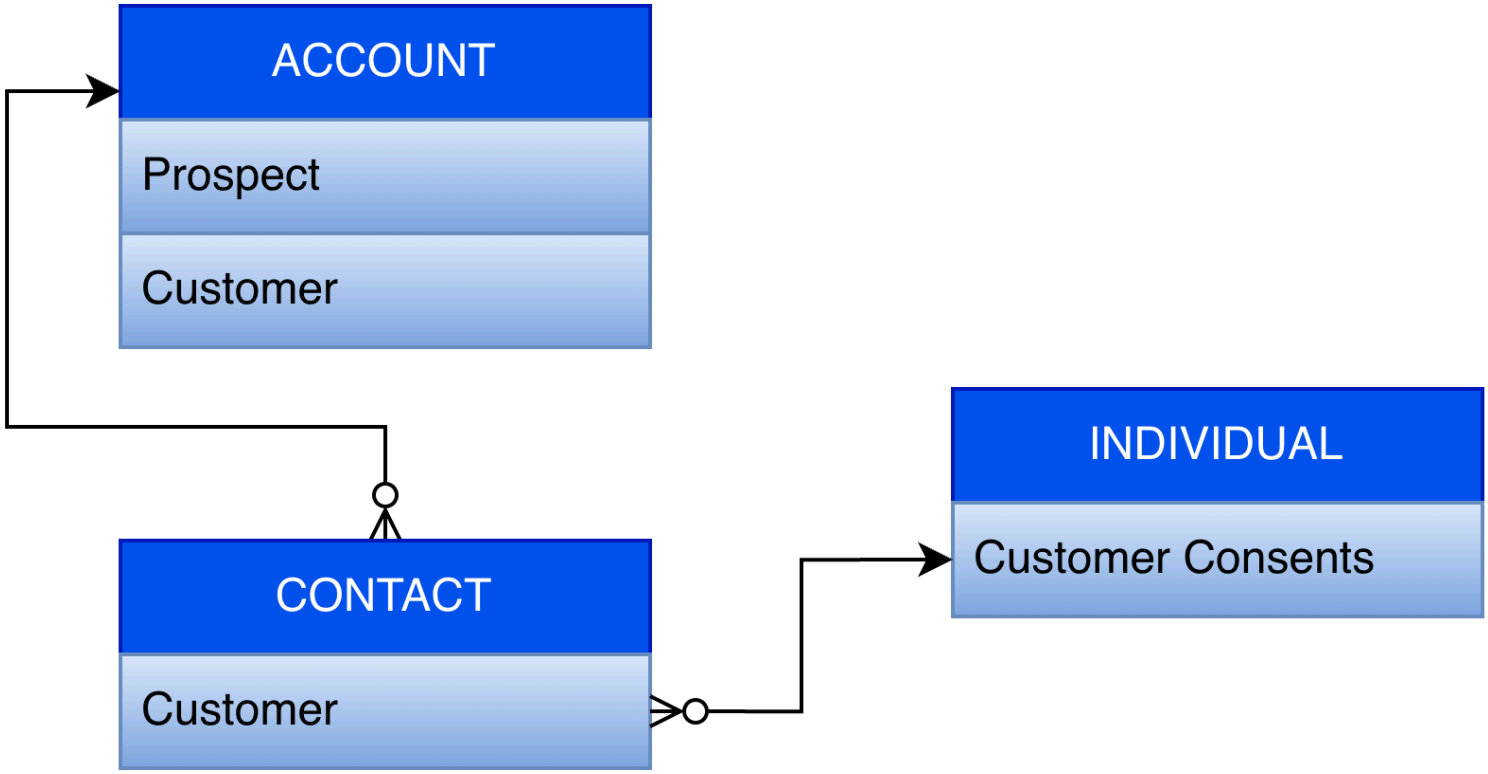
In the first case, if we reuse the Lead qualification process, we would need to generate a new Lead. However, at the time of qualification, the system will detect that an Account record already exists. The contact will then be associated with that existing record, preventing the creation of a duplicate Account and eliminating the need to validate said Account if it is already a Customer-type record rather than a Prospect.

Consent records will be inherited from the Lead to the Contact if they have already been registered. Otherwise, they can be recorded directly within the Contact object.



Alternatively, the contact can be generated directly from the page of Account. We also have the option to block the creation of contacts for Prospect-type Accounts if deemed appropriate or necessary.

In this case, as it does not originate from a Lead record, consents should be registered directly within the Contact. To this end, the procedure to follow would be the same as previously discussed for the preceding scenario.



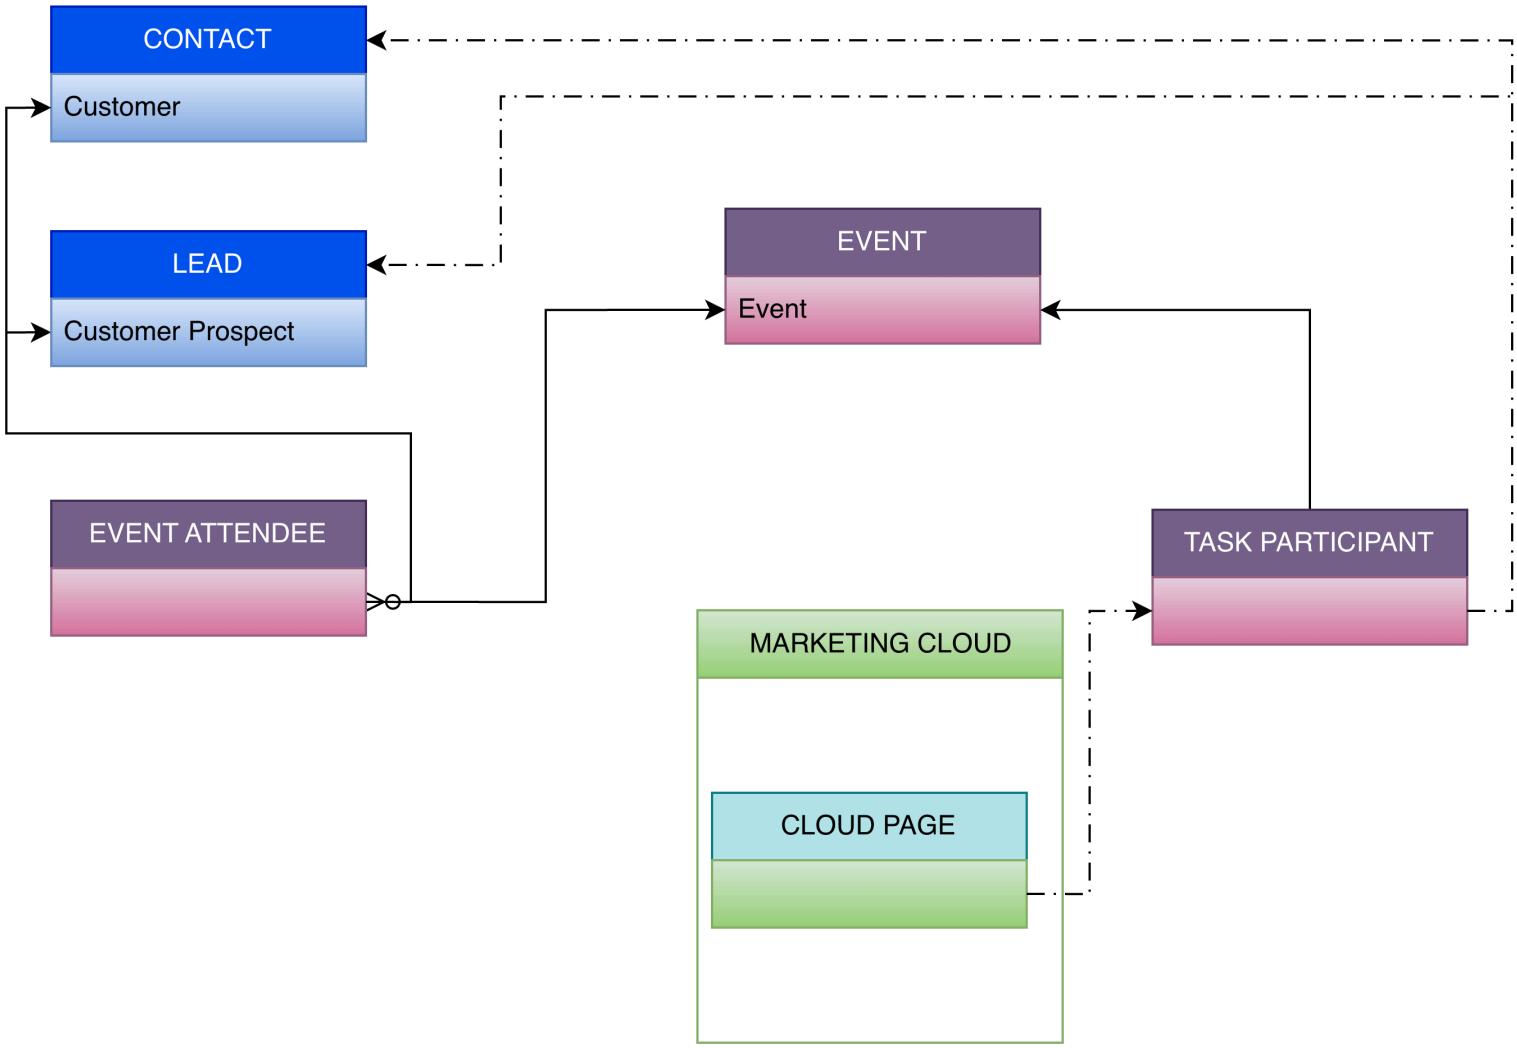
Scenario 3: Marketing Cloud

When an event takes place, **users can register their information via a Marketing Cloud CloudPage**.

This information will be stored in an object called **Task Participant**, which will function as a table containing data submitted by all users associated with an event.

Salesforce will attempt to use this information to identify if a **matching Contact or Lead already exists in the system** to link them to the event. This process is not intended for events where a specific invitation was sent to an existing Contact or Lead (as they are already in the system), but rather for events where no prior invitation was issued.

If no record is found to identify the registrant, **sales users can access this table to manually associate the Task Participant with the correct Contact or Lead record**, or, if appropriate, **generate a new record**. This new registration would be carried out through scenarios 1 or 2.



All event attendees will be recorded in the **Event Attendee** object, which links a Contact or a Lead to an Event (applicable both for direct invitations and for those detected automatically by the system or manually by the user via the Task Participant information).
