Distributor Data Model

For managing distributors, we will need a simpler structure than in the case of customers:

Standard

- **Account**: This object will record primary information for Distributors (qualified distributors)and Prospects (distributors awaiting qualification validation).
- **Contact**: This will contain information related to the contacts of either a distributor or a prospect. These are linked to a distributor account.
- **Lead**: This object facilitates the initial registration of a new distributor prospect prior to the necessary validations for qualification as a "Prospect" type Account

Custom

- **Data Change Request**: This object is used to record information for Prospect-type Accounts that must be submitted to SAP for validation.
- **Data Change Request Field**: Identifies specific changes made to a "Prospect" type Account to gather necessary data for SAP transmission and maintain historical traceability.
- **Account Relationship**: This object is used to connect a distributor with customers. The master data is SAP, so in Salesforce it will be read-only.
