Opportunity Product

To effectively provision **Opportunity Products** and ensure correct configuration across diverse sales scenarios (Renewal, Competitive, and Mix), the standard `OpportunityLineItem` object requires specific functional extensions.

Standard Fields Configuration

The architecture will reuse the following standard Salesforce fields to maintain core transactional capabilities:

- **Opportunity:** The parent opportunity record.
- **Product:** The associated product entry.
- **Quantity:** The volume of the product.
- **Sales Price:** The unit price.
- **Total Price:** The calculated total.

Custom Fields Configuration

To expand system functionality and support the required business logic, the following custom fields must be implemented:

Field	Data Type	Notes
Asset	Lookup Asset	Enables the selection of competitor assets targeted for replacement or existing Werfen assets designated for renewal. The system will automatically populate the standard Product field with data derived from the linked Asset.
Business Unit	Picklist	Backed by a Global Value Set. This field is conditionally auto-populated, inheriting the Business Unit value from either the parent Opportunity or the linked Asset.
~~**Business Line**~~	~~Picklist~~	~~only apply for the "Other" Business Unit - Global Dependent Picklist. This field is conditionally auto-populated, inheriting the Business Unit value from either the parent Opportunity or the linked Asset.~~
Company Name	Text	Auto-populated with the Company Name extracted from the selected Asset. Designed to gracefully degrade to a manual, free-text entry field if the target asset is not currently documented within the Salesforce database.
Instrument Serial Number	Text	Auto-populated utilizing the **Serial Number** of the selected Asset. This field will intentionally remain blank for **Competitive** or **New/Incremental** placement types where a legacy asset does not exist.
Department	Text	Conditionally auto-populated with departmental data from the linked Asset. If no Asset is referenced, it acts as a manual free-text field for user input.
Placement Type	Picklist	**Values:** Renewal, Competitive, New/Incremental. Denotes the specific transactional nature of the item. It is mandatory to report this for Mix-type Opportunities. In Renewal Opportunities, the value will always be Renewal, and in Competitive Opportunities, it can be Competitive or New/Incremental.
Affected	Checkbox	Identifies whether the record is actively impacted by the opportunity or included strictly for informational purposes. System logic for Revenue calculations will be strictly filtered to only aggregate products where the **Affected flag is True**, a valid **Placement Type** is populated, and the entity is confirmed as part of the **Werfen company**.
Status	Picklist	**Values:** Open, Won, Lost, Cancelled. Allows tracking the individual lifecycle and outcome of each specific line item independently from the parent Opportunity's overarching stage. Required for **Mix-type Opportunities**
Closed Reason	Picklist	**Values:** Brand loyalty, Features, Price, Menu. It is recommended to enforce a Validation Rule or Field Dependency ensuring this field is only accessible and strictly required when the item's Status is updated to Lost or Cancelled and only for **Mix-type Opportunities**.

Screen Overview

The **Opportunity Product Management** suite consists of a Lightning Web Component (`WESAL_lwc_opportunityProductsItem`) and a guided Flow (`WESAL_vw_quickActionNewOppProduct`). It is designed to

provide a centralized, high-performance interface for managing `OpportunityLineItem` records with specific business logic tied to Opportunity Record Types and Asset relationships.

Technical Architecture

Lightning Web Component (LWC)

- **API Name:** `WESAL_lwc_opportunityProductsItem`
- **Data Fetching:** Utilizes **GraphQL** (`lightning/uiGraphQLApi`) to retrieve records and cross-object relationships (Product2, Asset) without Apex.
- **Data Mutation:** Uses `uiRecordApi` (`updateRecord`, `deleteRecord`) for bulk operations.
- **Responsive UI:** Implements `wrapText` for long strings and dynamic height adjustment to prevent empty gray margins.

Component Columns

Label	API Name	Editable	Logic / Constraints
Business Unit	`WESAL_fld_businessUnit__c`	No	Displays Picklist Label.
Company	`WESAL_fld_company__c`	No	Text field.
Instrument Model	Relationship	No	Linked to record. Displays `Asset.Name` if present, otherwise `Product2.Name`.
Serial Number	`WESAL_fld_instrumentSerialNumber__c`	No	Truncation prevented via `wrapText`.
Department	`WESAL_fld_department__c`	Yes	Bulk editable.
Placement Type	`WESAL_fld_placementType__c`	Yes	**Custom Picklist:** (Competitive, New/Incremental). Read-only if 'Renewal' or Empty.
Affected	`WESAL_fld_affected__c`	Yes	Boolean checkbox.
Quantity	`Quantity`	Yes	**Constraint:** Read-only if record is linked to an `Asset`.
Unit Revenue	`UnitPrice`	Yes	Standard currency input.
Total Revenue	`TotalPrice`	No	Calculated field.

Flow Logic

- **API Name:** `WESAL_vw_quickActionNewOppProduct`

The flow is triggered via the "Add New Opportunity Product" button. It enforces strict product/asset selection rules based on the Opportunity's **Record Type**.

Selection Rules by Record Type

Record Type	Allowed Actions	Filtering Logic
Renewal	Add **Werfen Assets**	Assets must belong to the Opportunity's Account and match the Opportunity's Business Unit.
Competitive	Add **Werfen Products** & **Competitor Assets**	**Products:** New Werfen products only (matching BU). Specify Placement (New/Inc. or Comp.). **Assets:** Competitor assets from the Account (matching BU). Toggle "Affected" status.
Mix	**Full Access**	Can add Werfen Assets, Competitor Assets, and New Werfen Products simultaneously.

The MIX Summary Screen

For "Mix" Opportunities, the record page includes two additional tabs to detailed summary. This tabs calculates:

- **Revenue Distribution:** total revenue attributed to *Renewal*, *Competitive*, and *New/Incremental* placements.
- **Impact Analysis:** Percentage of assets and products marked as "Affected" categorized by placement type.

Interaction & Validation Rules

Bulk Actions

- **Bulk Update:** Users can edit multiple rows and save simultaneously. If a validation rule is triggered (e.g., editing Quantity on an Asset-linked item), the entire transaction is rolled back with a Toast error message.
- **Bulk Delete:** Users select rows via checkboxes and use the "Delete Selected" button. A confirmation prompt is required.

Data Integrity

> [!IMPORTANT]

Placement Type Lock: Editing is blocked for records where the value is "Renewal" or empty to prevent misalignment with automated renewal processes.
Quantity Lock: If `WESAL_fld_asset__c` is populated, the `Quantity` field is strictly read-only to ensure synchronization with the physical inventory record.

Setup & Configuration

1. **Placement:** Add the LWC to the **Opportunity Record Page**.
2. **Flow Access:** Ensure the user has "Run Flows" permissions and the Flow is **Activated**.
3. **Input Variable:** The Flow must contain a variable named `recordId` (Type: Text, Available for Input) to receive the Opportunity ID from the LWC.
