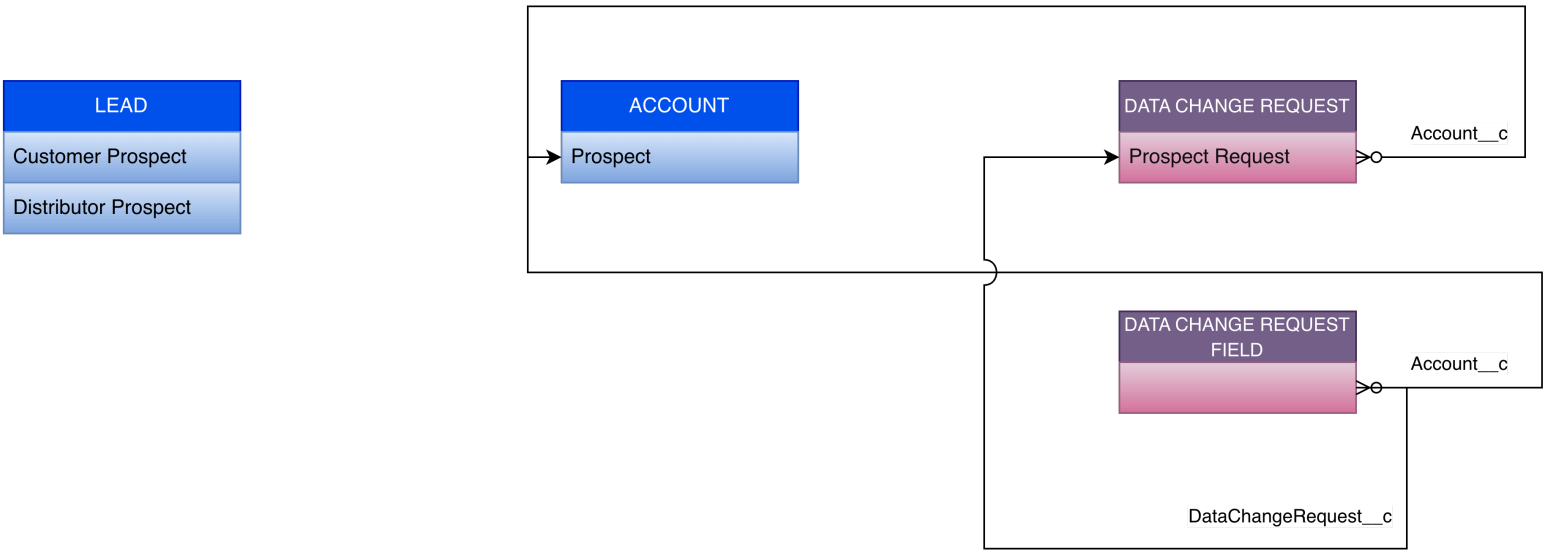
To complete the qualification and processing of a Prospect created by a back-office user, the record must be sent to SAP.

Once the processing in MDM is finalized, the result must be automatically handled and made available to the designated users within Salesforce.



For more information: CU-17 Sales Strategy

Data Change Request: Prospect Request

A new custom object, **Data Change Request** with **Prospect Request** record type, will be created to store the data modification requests that must be sent to SAP.

Key Fields:

- **External Id**: A unique identifier shared with SAP to correlate the record between both systems - Text
- **Send Date**: Date when the Prospect Account was sent to SAP - Datetime
- **Response Date**: Date when an update from SAP was received - Datetime
- **Account**: the Account record that has been created/modified - Master-Detail relationship to Account
- **Status** - Picklist (Pending / Error / Rejected / Validated)
- **Last Communication Date** - Datetime

Data Change Request Field: Field Change Request

This object will store the fields included in the change request sent to SAP.

Key Fields:

- **Data Change Request** - Data Change Request Lookup
- **Account**: the Account record that has been created/modified - Master-Detail relationship to Account
- **Old Value** - Text
- **New Value** - Text
- **Field** - Text
- **Update Date** - Datetime

This object will appear as a **Related List** in:

- Data Change Request
- Account

Automation and Integration Components

Apex Trigger or Flow Trigger for SAP Outbound Processing

When an Account with Record Type **Prospect** is created/modified, the system must generate a Data Change Request.

To ensure data consistency and avoid duplicated synchronization processes, the system will maintain **only one active Data Change Request** for each Prospect whose information is pending validation in SAP.

When a **Prospect** Account is edited, the system will first identify whether an existing Data Change Request with a **pending status** already exists (f.e., **Pending**, **Error**, or **Rejected**). If such a record is found, it will be reused rather than creating a new one.

This approach guarantees a single point of control for the outbound synchronization of each Prospect.

Cascading Creation of Data Change Request Fields

Instead of generating multiple Data Change Requests, every change detected on the Prospect will result in the creation of **additional Data Change Request Field** records associated with the same Data Change Request.

Each record entry will contain the field name, old value, new value, and timestamp of the change. This allows the system to accumulate all modifications performed on the Prospect while the data change request remains pending.

During the outbound communication process, all data change request fields entries linked to the same Data Change Request will be grouped into a single payload, ensuring that SAP receives a complete and consolidated view of all changes performed.

Salesforce → SAP Integration

A communication interface should send the data stored in Data Change Request to SAP.

Sending to SAP for validation.

It is not possible to send a prospect to SAP for validation if all the indicated fields have not been correctly filled out.
