## Visit Management

### Account Plan: Planning

A new record with the **Planning** Record Type may be created in a new custom object called **Account Plan**, with the purpose of **centralizing and displaying relevant customer information**, linking activities and opportunities, and attaching documentation related to the customer's situation and analysis.

This model therefore allows multiple planning records to exist under the same customer, facilitating document management and activity tracking within the account.

More information: Account Plan Management

### Business Activity: Customer Activity

We will use a new custom object called **Business Activity** to manage the activities carried out within an **Account Plan**, populating the new custom field **AccountPlan__c** for this purpose.

These activities can be linked to the **Account** via a new custom field **Account__c**, and to multiple opportunities through a new custom object **Opportunity Activity Relationship** with the Record Type **Opportunity Activity Relation**. To do so, the new custom object must populate the fields **Opportunity__c** and **Buesiness Activity__c**.

Some Business Activity key fields:

- **Account** - Account Lookup
- ~~**Account Plan** - Account Plan Lookup~~
- **Business Unit** - Global picklist
- **Type** - Global Picklist
- **Subtype** - Type dependent global picklist
- **Activity** - Subtype dependent global picklist
- **Contact** - Contact Lookup - TBC
- **Department** - Multi-picklist
- **Department 2** - Department dependent Multi-picklist
- **Department 3** - Text
- **Content** - TBC
- **Solution** - Business Unit dependent picklist
- **Panel** - Business Unit dependent picklist
- **Importance** - Checkbox
- **Due Date** - Date
- **Status** - Picklist (Planned / Scheduled / Overdue / Ongoing / Completed / Cancelled)
- **Comments** - Text Area

*A user cannot create an activity for a business unit to which they do not belong (if they are not in the public group of that business unit).*

Related to: Account Plan Management

#### Business Activity Statuses

The activities will use the following status values: **Planned**, **Scheduled**, **Ongoing**, **Overdue**, **Completed**, and **Cancelled**. **Default status is Planned**; **when a Visit is created** and linked, the system may **auto-update to Scheduled** according to the operating rules.

### Visit: Customer Visit

We will introduce a new custom object **Visit** with the Record Type **Customer Visit** to allow users to create and manage customer visits in Salesforce.

Visits can be defined in the context of an **Opportunity**, **Account Plan**, or **Account**. Regardless of the origin, each Visit must be related to **at least one Activity** through the custom junction object **Activity Visit**.

Operationally, the Visit acts as the **calendar representation** (date, time, location, attendees) of one or more Activities (f.e., demos, workshops, customer meetings), supporting scheduling and preparation workflows.

For this reason, when we generate a visit, we will create an Activity Event record containing the visit's date information (so it can be displayed on the calendar). This **Event will include a lookup to the Visit** and will also be related to the customer's Account.

If I update a Visit record, the Event is automatically updated. Similarly, if I update an Event record associated with a Visit, the Visit is automatically updated. Therefore, I need two trigger flows, one in Visit and one in Event. **This keeps both records synchronized**.

**Visit key fields:**

- Account: Account Master-Detail Lookup
- End Date: Datetime
- Location: Text
- Start Date: Datetime
- Subject: Text
- Comments: Text Area
- Status - Picklist (Planned / Scheduled / Overdue / Ongoing / Completed / Cancelled)

**Activity key fields:**

- Visit: Visit Lookup
- End Date Time: Visit - End Date
- Location: Visit - Location
- Start Date Time: Visit - Start Date
- Subject: Visit - Subject
- Related To ID: Visit - Account
- Assigned to ID: Visit - OwnerId

**Visit Attendee: Contact Attendee, Prospect Attendee, Supervisor**

**To facilitate guest management**, we will use a new custom object **Visit Attendees** which will generate the corresponding records in the **Event Relation** object through a flow.

We will need 3 RecordTypes: **Contact Attendee**, **Prospect Attendee** and **Supervisor**. Each of them will only allow adding the attendee to their corresponding lookup: Contact, Lead or User.

We will have an Attendee formula field that allows us to navigate to the corresponding record independently of the lookup that is reported, to allow correct visualization in the related list of the object.

**Visit Attendee key fields:**

- Attendee: Formula Field = `IF(NOT(ISBLANK(ContactAttendee__c)), HYPERLINK("/" & ContactAttendee__c, ContactAttendee__r.FirstName & ", " & ContactAttendee__r.LastName, '_self'), IF(NOT(ISBLANK(Supervisor__c)), HYPERLINK("/" & Supervisor__c, Supervisor__r.FirstName & ", " & Supervisor__r.LastName, '_self'), HYPERLINK("/" & ProspectAttendee__c, ProspectAttendee__r.FirstName & ", " & ProspectAttendee__r.LastName, '_self')))`
- Contact Attendee: Contact Lookup
- Prospect Attendee: Lead Lookup
- Supervisor: User Lookup
- Visit: Visit Master-Detail Lookup
- Type Attendee: Formula Field = `IF(NOT(ISBLANK(ContactAttendee__c)), "Contact", IF(NOT(ISBLANK(Supervisor__c)), "Supervisor", "Prospect"))`
- Relation ID: Formula Field = `IF(NOT(ISBLANK(ContactAttendee__c)), ContactAttendee__c, IF(NOT(ISBLANK(Supervisor__c)), Supervisor__c, ProspectAttendee__c))`
- Role: Picklist -> Defines the specific function or classification of the individual in a given context (f.e, Customer, Werfen Reviewer, Speaker, Organizer, etc.)

**Event Attendee key fields:**

- Event ID: Visit Attendee - Visit
- Relation ID: Visit Attendee - Relation ID

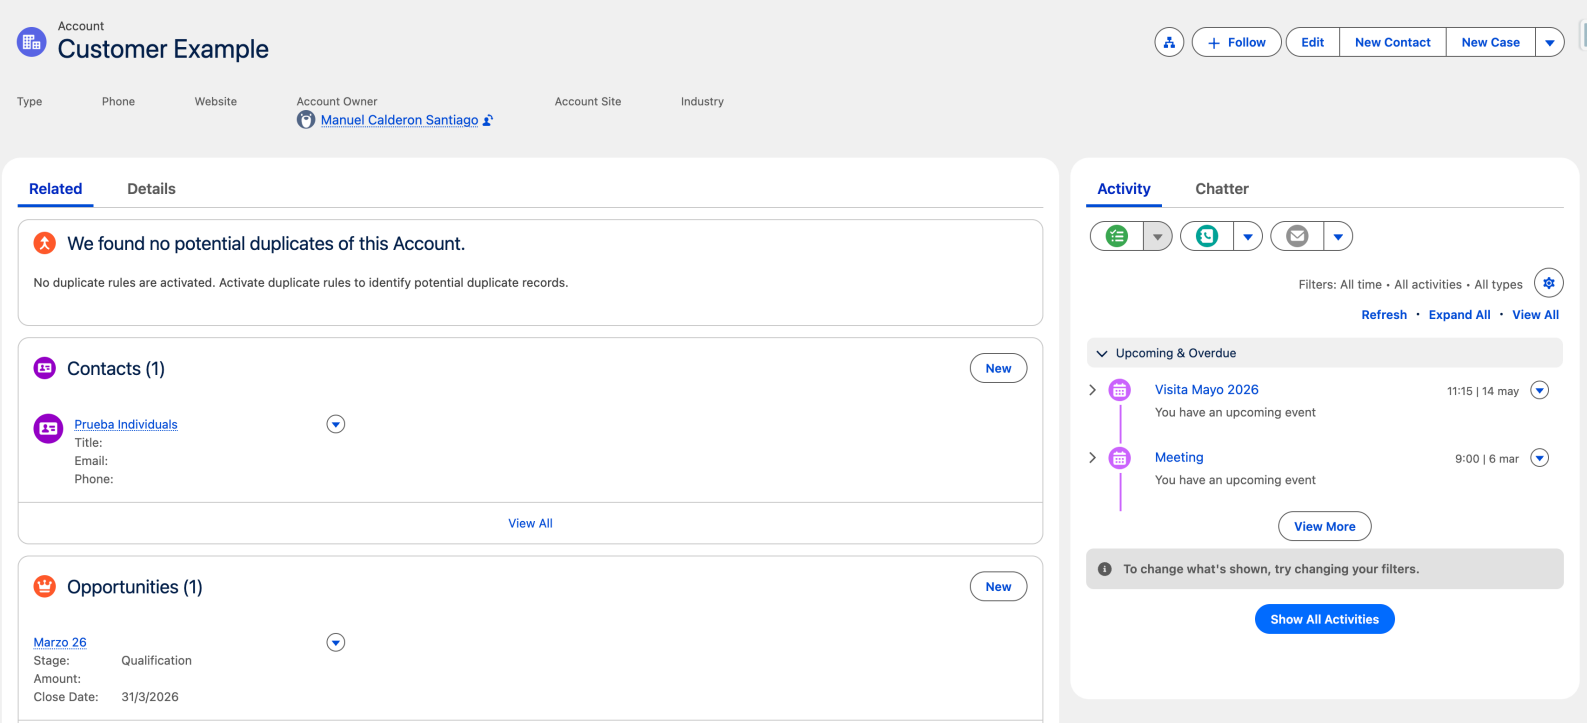
Upcoming & Overdue

Visita Mayo 2026 — 11:15 | 14 may
You have an upcoming event

Meeting — 9:00 | 6 mar
You have an upcoming event



### Activity Visit: Activity Visit

Any **Activity** can be related to **one or more Visits**; likewise, any **Visit** can be related to **one or more Activities**.

To model this **many-to-many** relationship, we will create the custom junction object **Activity Visit** with a dedicated Record Type, storing at minimum the lookups **Business Activity** and **Visit**. (This aligns the CRM data model with the process in which scheduling and execution of Activities may require multiple calendar events).

#### Activity Visit key fields:

- Visit: Visit Lookup
- Business Activity: Business Activity Master-Detail Lookup

### Activity Member: Activity Member

To support a many-to-many relationship between **Business Activities** and internal Salesforce users, a new custom object, **Activity Member**, will be implemented. This object allows for the association of multiple team members with a single activity record via a related list.

Field Specifications:

- **Business Activity:** Lookup relationship to the **Business Activity** custom object.
- **Member:** Lookup relationship to the **User** object.

To maintain data quality, a control mechanism shall be enforced to **prevent duplicate records**. The system must block any attempt to associate the same User with the same Business Activity more than once.

**Technical Note:** This will be enforced via a **Unique Technical Key** (text field populated via Flow: `ActivityID + UserID`) marked as **Unique** and **External ID**, or through a **Validation Rule** using the `VLOOKUP` or `COUNT` logic to identify existing intersections.

#### Automation: Team Member Notifications

A **Record-Triggered Flow** will be implemented on the **Activity Member** object. Upon the creation of a new member record, the system will trigger a **Custom Bell Notification** to the added user.

- **Notification Trigger:** Record Creation.
- **Recipient:** The User identified in the **Member** field.
- **Content:** An automated alert informing the user that they have been added to the internal team of the specific Business Activity.

### Opportunity Visit Relationship: Oportunity Visit

Any **Opportunity** can be related to **one or more Visits**; likewise, any **Visit** can be related to **one or more Opportunties**.

To model this **many-to-many** relationship, we will create the custom junction object **Opportunity Visit Relationship** with a dedicated Record Type, storing at minimum the lookups **Opportunity** and **Visit**.

#### Opportunity Visit Relationship key fields:

- Visit: Visit Master-Detail Lookup
- Opportunity: Opportunity Master-Detail Lookup

#### Business Logic & Duplicate Prevention

To prevent the creation of redundant records, the UI and automation will follow these rules:

- **Visit Discovery:** When a user is in an **Opportunity**, they can use a "Link Existing Visit" action. The system will automatically suggest Visits that are already associated with the same **Business Activity** or **Account**, preventing the user from creating a new "duplicate" visit for the same event.
- **Unified Timeline:** The Opportunity's Activity Timeline will now aggregate all related Visits via this junction, providing a chronological history of every physical interaction that pushed the deal forward.

#### Architectural Insight: Closing the Loop

By linking **Visits** to **Opportunities**, you enable advanced **Sales Velocity** reporting:

- **Effort vs. Result:** You can now report on the *number of visits* required to close a specific type of deal.
- **Cost of Sale:** By aggregating the time spent on Visits (linked to Opportunities), Finance can better understand the resource investment per Business Unit.

> **Technical Tip:** A **Validation Rule** on the Junction Object to ensure that a Visit and an Opportunity can only be linked if they both belong to the same **Account**. This maintains data integrity across the relationship.
